

REDROB AI | DISCOVERY & RANKING

Intelligent Candidate Ranking System

Key Objective: Filter and rank the top 100 highly qualified AI Engineering candidates from a database of 100,000+ profiles.

Our Methodology

01. FILTERING

Honeypot / Trap

Detected and removed 80+ "trap" profiles using behavioral signal analysis. Identified by anomalous patterns like high response rates combined with low connectivity.

02. SCORING

JD-Centric Engine

Applied semantic matching to extract key competencies including LLM, RAG, Production-scale ML, and Retrieval Systems for precision ranking.

03. ADJUSTMENT

Behavioral Re-Ranking

Adjusted rankings based on recruiter-engagement signals, ensuring only active, market-ready candidates are prioritized for the final pool.

Technical Highlights & Compliance

INFRASTRUCTURE

Architecture

Built a highly optimized, custom Python-based ranking pipeline designed for efficiency and scalability.

EFFICIENCY

Performance

Fully compliant with strict compute constraints, operating within 16GB RAM and a 5-minute execution limit.

QUALITY

Data Integrity

Rigorous adherence to data schema and formatting specifications to ensure seamless integration into existing systems.

Conclusion

Moving Beyond Keywords

Our solution delivers a holistic ranking approach that balances deep technical expertise (LLM, RAG) with behavioral reliability to secure the highest quality founding AI engineering team.
